

Energy Policy Nordmann, Rassmann GmbH

For Nordmann, Rassmann GmbH, success also means assuming social and ecological responsibility. Within the corporate framework of the Georg Nordmann Aktiengesellschaft, the values of responsible and sustainable management apply.

As a contribution to sustainable development, Nordmann, Rassmann GmbH maintains an ISO 50001 energy management system to achieve a continuous energy performance improvement.

Nordmann, Rassmann undertakes to fulfil all applicable legal requirements and moreover define own objectives for improving its environmental performance and energy efficiency. This includes, among others, the economical use of resources and the use of electricity produced from renewable energy sources. When procuring services or purchasing products, the use of environmentally friendly, energy-efficient products is encouraged.

The resources needed for implementing and maintaining the energy management system are provided, and compliance with the declared energy policy is periodically checked.

All employees are informed about the energy policy and are involved in the energy management system. Motivation and training strengthen their awareness of energy-saving behaviour and they have the opportunity to contribute their own ideas regarding the conservation of resources at every level.

Energy consumption and all essential energy aspects are constantly recorded and monitored. Where necessary, corrective actions are initiated.

Furthermore, the energy management system is assessed and certified by an independent organisation on a regular basis.
